Objectives

- To learn about functions and how to use them to write programs with separate modules.
- To understand how control flows between function main and other functions.
- To learn how to pass information to functions using input arguments.
- To learn how to return a value from a function.

Top-Down Design

top-down design

- a problem solving method
- first, break a problem up into its major subproblems
- solve the subproblems to derive the solution to the original problem

House and Stick Figure

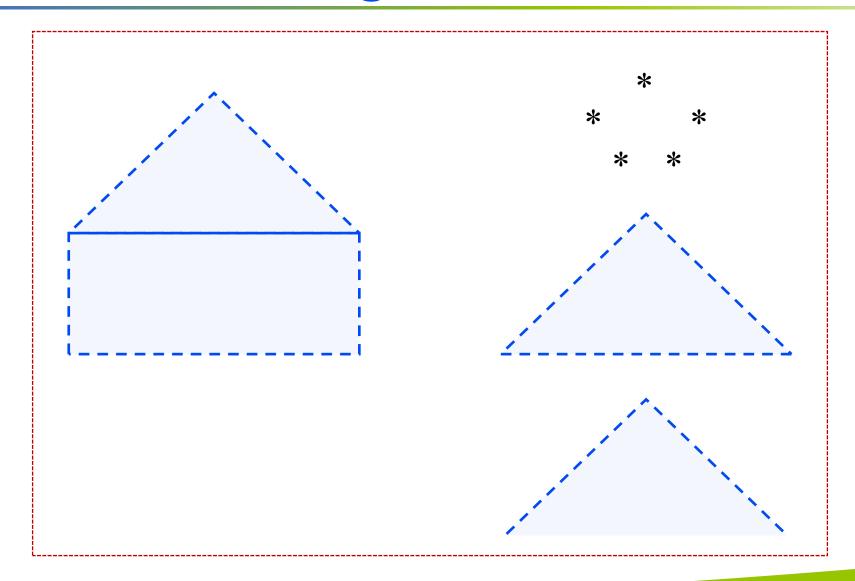

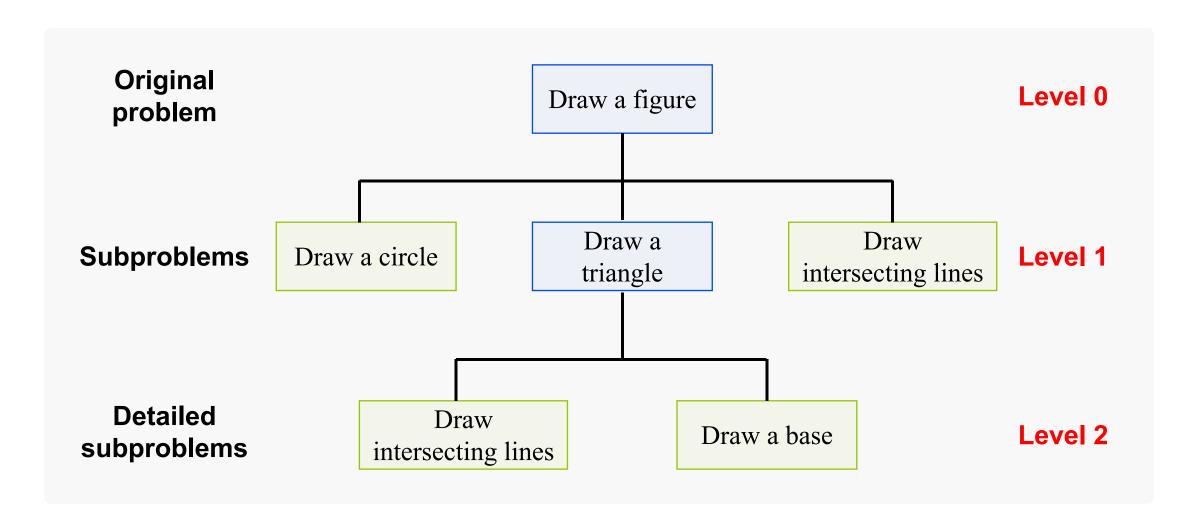

Figure Structure Chart for Drawing a Stick Figure

Functions Call Statement (Function Without Arguments)

Syntax

```
fname();
```

Example:

```
draw circle();
```

- Interpretation
 - the function fname is called
 - after fname has finished execution, the program statement that follows the function call will be executed

Figure Function Prototypes and Main Function for Stick Figure

```
* Draws a stick figure
#include <stdio.h>
                             /* printf definition */
/* function prototypes */
void draw circle(void);
                              /* Draws a circle
void draw_intersect(void);
                              /* Draws intersecting lines
void draw base(void);
                                                              */
                              /* Draws a base line
void draw_triangle(void);
                              /* Draws a triangle
int
main (void)
       /* Draw a circle. */
        draw circle();
        /* Draw a triangle. */
        draw triangle();
        /* Draw intersecting line. */
        draw intersect();
       return (0);
```

Function Prototype (Function Without Arguments)

Syntax

```
ftype
fname(void);
Example:

void
```

draw circle(void)

- Interpretation
 - the identifier fname is declared to be the name of a function
 - the identifier ftype specifies the data type of the function result

Figure Function draw_circle

```
* Draws a circle
*/
void
draw circle(void)
      printf(" * \n");
      printf(" * *\n");
      printf(" * * \n");
```

Function Definitions (Function Without Arguments)

Syntax

```
ftype
fname(void)
{
    local declarations
    executable statements
}
```

Figure Function draw_triangle

```
* Draws a triangle
*/
void
draw triangle(void)
       draw intersect();
       draw base();
```

Advantages of Using Function Subprogram

procedural abstraction

 a programming technique in which a main function consists of function calls and each function is implemented separately

Reuse of function subprograms

functions can be executed more than once in a program

Figure Flow of Control Between the main Function and a Function Subprogram

Computer memory

Functions with Input Arguments

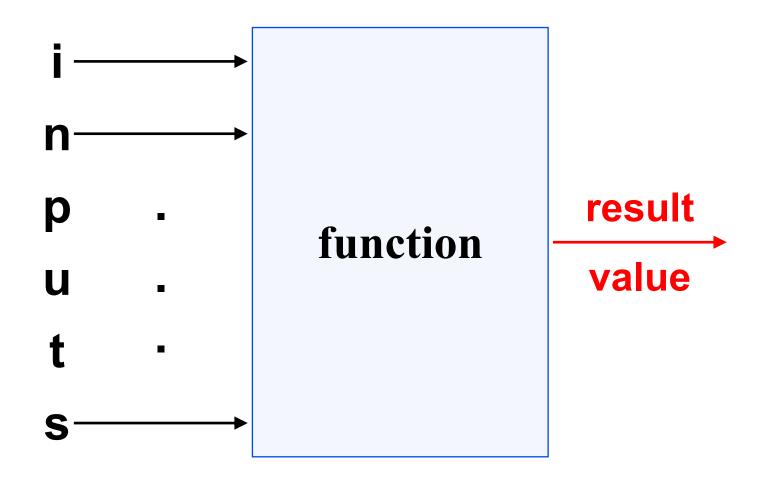

input argument

 arguments used to pass information into a function subprogram

output argument

arguments used to return results to the calling function

Figure Function with Input Arguments and One Result

Functions with Multiple Arguments

Argument List Correspondence

- The number of actual arguments used in a call to a function must be the same as the number of formal parameters listed in the function prototype.
- Each actual argument must be of a data type that can be assigned to the corresponding format parameter with no unexpected loss of information.

Functions with Multiple Arguments

Argument List Correspondence

- The order of arguments in the lists determines correspondence.
 - The first actual argument corresponds to the first formal parameter.
 - The second actual argument corresponds to the second form parameter.
 - etc.

THE END
